

HERMES / Sheet Import Process Flow

Generated for the Invent hardware inventory project.

End-to-End Flow

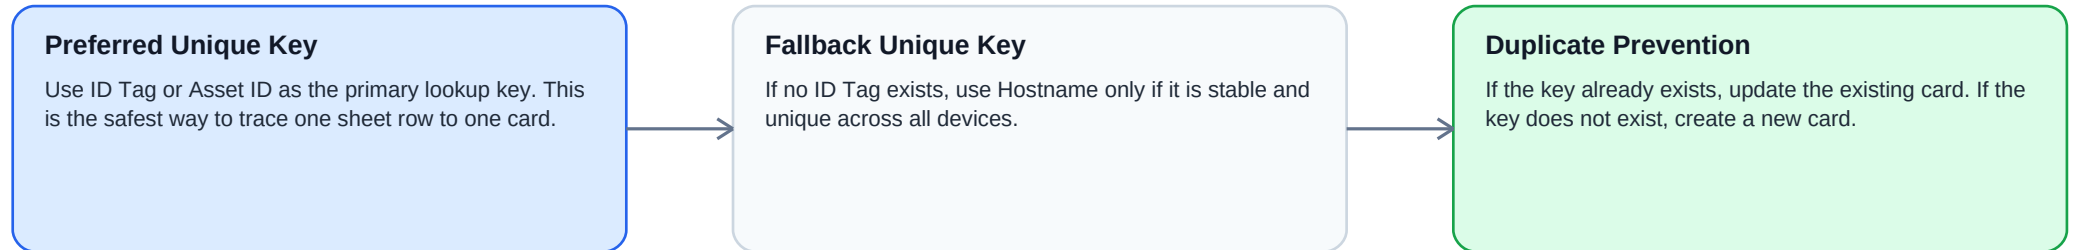

Recommended Sheet Columns

Sheet Column	Maps To	Required?	Notes
ID Tag or Asset ID	Asset.idTag or Asset.id	Yes	Use this as the primary matching key to prevent duplicate cards.
Full Name	Asset.name	Yes	Displayed as the card name.
Department	Asset.department	Yes	Used for filtering and department badge.
Username	Asset.username	No	Internal username or login name.
Omada Username	Asset.omadaUsername	No	Can be renamed later if this is really email.
Hostname	NetworkSpec.hostname	No	Can also be used as a fallback matching key.
CPU Model / CPU Cores	CpuSpec	No	CPU cores should be numeric.
RAM / Storage / GPU	RamSpec, StorageSpec, GpuSpec	No	Multiple devices can be supported later with repeated columns or separate rows.

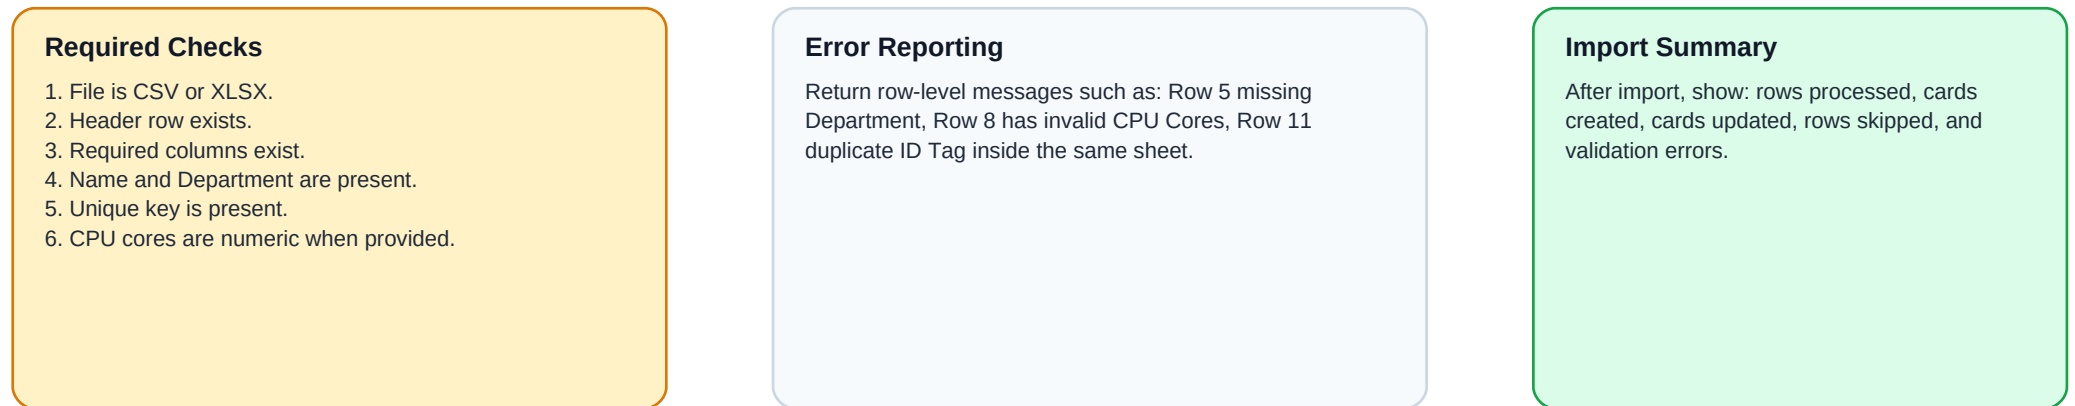

Import Rules And Validation

How the backend should decide whether each sheet row creates, updates, or fails.

Primary Key / Matching Rule

Validation Checklist

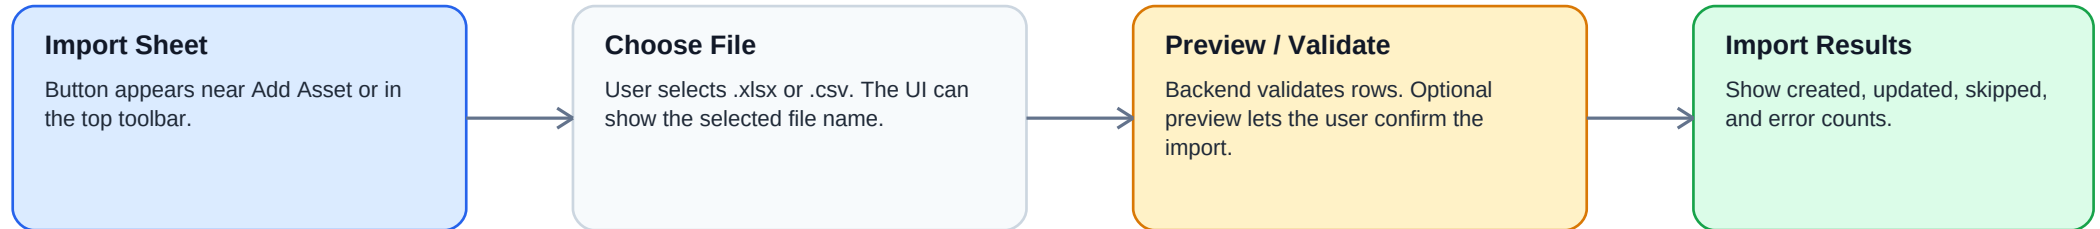

Security And Deployment Notes

1. The frontend uploads the sheet to Django; secrets and database writes stay in the backend.
2. The backend should reject very large files and unsupported file types.
3. Do not trust column values blindly; validate before saving to Neon.
4. Keep HERMES credentials, if any, in backend environment variables only.
5. If HERMES has an API later, the backend can fetch the sheet automatically instead of requiring manual upload.

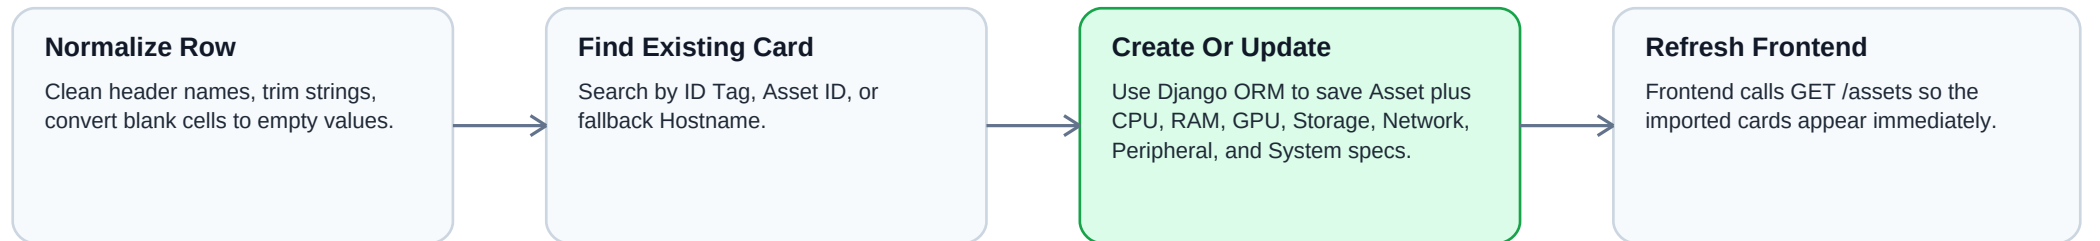

User Experience Flow

What the user should see while importing a HERMES or Excel sheet.
